

The migration from MySQL to PostgreSQL completed in March 2026 after two false starts. The cutover took forty minutes and no rows were lost. Replication lag peaked at eleven seconds during the switch. The rollback plan was never used.

Caching is served by Redis with a sixty second time to live. Cache hits account for roughly eighty percent of read traffic at peak. The eviction policy is allkeys-lru and the working set fits in four gigabytes.

Deployment runs on three Kubernetes replicas behind an nginx ingress. Rolling updates take about ninety seconds. The readiness probe checks the database connection, not just the process.
